Healthier Gums Start with Professional Cleaning

Bleeding gums, persistent bad breath and redness around the teeth can be signs of gum inflammation. When plaque and hardened tartar build up around or below the gum line, routine brushing alone may not be enough to keep the area clean.

Scaling and curettage refers to periodontal procedures used to remove deposits from the teeth and, when indicated, treat diseased tissue in the gum pockets. The exact treatment depends on the severity of gum disease and the findings during a dental examination.

At Jerush Dentofacial & Cosmetic Laser Centre, a gum assessment helps determine whether routine scaling, deeper periodontal cleaning or additional gum treatment is appropriate.

What Are Scaling and Curettage?

Scaling removes plaque and hardened deposits, known as calculus or tartar, from tooth surfaces. When gum disease has developed below the gum line, the dentist may recommend deeper cleaning to remove deposits from the root surfaces.

Curettage traditionally refers to removing diseased or inflamed tissue from the gum pocket. It is a more specific procedure and is not automatically required whenever scaling is performed. Its use depends on the clinical findings and the treatment approach selected by the dentist.

These procedures aim to control the bacterial deposits associated with gum disease and help create healthier conditions around the teeth.

When Might You Need This Treatment?

Your dentist may recommend periodontal cleaning if you notice symptoms such as:

- Bleeding gums while brushing or flossing.

- Redness or swelling around the teeth.

- Tartar deposits that cannot be removed with a toothbrush.

  "C:\Jerush-dentoface-new-site-react\public\images\medical-services\dental-care\periodontal-gum-care\scaling-curettage\tartar-deposits.webp"

- Gum pockets where plaque and bacteria collect below the gum line.

  "C:\Jerush-dentoface-new-site-react\public\images\medical-services\dental-care\periodontal-gum-care\scaling-curettage\gum-pockets.webp"

- Early signs of gum disease that require professional cleaning and monitoring.

Gum disease can sometimes progress without obvious pain. If you notice bleeding or changes in your gums, a dental assessment can help identify the cause before the condition becomes more advanced.

How Is Scaling and Curettage Performed?

The treatment is planned according to the condition of your gums and the amount of deposits present.

Gum examination

The dentist checks your gums, measures periodontal pockets when needed and identifies areas with plaque, tartar or inflammation.

Scaling and deposit removal

Specialised dental instruments remove hardened deposits from the tooth surfaces. If required, deeper cleaning is performed around the roots beneath the gum line.

3. Additional gum treatment, if indicated

In selected cases, the dentist may perform curettage or another periodontal procedure to address diseased tissue. This is not necessary for every patient.

4. Healing and review

You receive guidance on brushing, interdental cleaning and follow-up care. The dentist reviews gum health and recommends further treatment if needed.

Benefits of Professional Gum Treatment

Appropriate periodontal cleaning can help:

- Reduce plaque and tartar buildup.
- Improve gum inflammation and bleeding associated with deposits.
- Reduce bacterial deposits beneath the gum line.
- Support better oral hygiene and gum health.
- Help manage gum disease and reduce the risk of further progression when combined with ongoing care.

Results depend on the severity of gum disease, home-care habits and regular periodontal maintenance. Advanced gum disease may require additional treatment beyond scaling and curettage.

Aftercare: Keeping Your Gums Healthy

Your gums may feel tender or bleed slightly after deeper cleaning, particularly if they were already inflamed. Follow the instructions provided by your dentist.

- Brush twice daily using a soft-bristled toothbrush.

- Follow any prescribed medication or mouth-rinse instructions.

  "C:\Jerush-dentoface-new-site-react\public\images\medical-services\dental-care\periodontal-gum-care\scaling-curettage\follow-any-prescribed.webp"

- Attend follow-up appointments to monitor gum pockets and inflammation.

  "C:\Jerush-dentoface-new-site-react\public\images\medical-services\dental-care\periodontal-gum-care\scaling-curettage\attend-follow-up-appointments.webp"

- Contact your dentist if you develop severe or increasing pain, swelling or persistent bleeding.

Professional cleaning removes existing deposits, but plaque can build up again. Consistent daily cleaning and periodic dental reviews are important for maintaining the results.

Before and After: Improving Gum Health

Frequently Asked Questions

1. What is the difference between scaling and curettage?

Scaling removes plaque and tartar from tooth surfaces. Curettage traditionally involves removing diseased or inflamed tissue from a gum pocket. Curettage is not required for every scaling procedure.

2. Is scaling and curettage painful?

You may experience mild discomfort or gum sensitivity. Local anaesthesia can be used for deeper cleaning or when needed, depending on the procedure and your comfort.

3. Will my gums bleed after treatment?

Some bleeding or tenderness can occur, particularly when the gums are inflamed. If bleeding is heavy, persistent or worsening, contact your dentist.

4. How many sessions are needed?

This depends on the amount of tartar, the number of affected areas and the severity of gum disease. Some patients need one cleaning appointment, while others may require treatment over multiple visits.

5. Can scaling and curettage cure gum disease permanently?

Treatment can help control gum disease, but it does not guarantee that the condition will never return. Daily oral hygiene and regular periodontal maintenance are essential.

6. Will my teeth become loose after scaling?

Scaling does not normally cause healthy teeth to become loose. However, advanced gum disease may already have damaged the supporting tissues, and existing mobility may become more noticeable after deposits are removed.

7. How often should I get my teeth cleaned?

The interval depends on your oral health and gum condition. Your dentist may recommend routine cleaning or more frequent periodontal maintenance if you have a history of gum disease.

Give Your Gums the Care They Need at Jerush

Healthy gums are an important part of maintaining your natural teeth. If you experience bleeding gums, persistent bad breath or visible tartar, a professional assessment can help you understand the cause and choose the right treatment.

At Jerush Dentofacial & Cosmetic Laser Centre, periodontal care begins with evaluating your gum health and recommending treatment suited to your needs.
