1. Kids Dentistry / Pedodontics

URL: /dental-care/kids-dentistry/pediatric-dental-care

Children need dental care that supports healthy teeth, comfortable eating, clear speech, and proper oral development. Pediatric dental care focuses on protecting children's teeth and gums from infancy through adolescence, while helping them build positive dental habits for life.

At Jerush Dentofacial & Cosmetic Laser Centre, pediatric dental care focuses on each child's age, dental development and individual needs. A calm, child-friendly approach can help children feel more comfortable during dental visits and make oral care a familiar part of their routine.

What Does Pediatric Dental Care Include?

Children may need different types of dental care as their teeth develop. Treatment recommendations depend on their age, oral health and clinical findings.

Preventive Dental Care

Regular check-ups, brushing guidance, dietary advice and fluoride treatment when appropriate help reduce the risk of tooth decay.

Treatment for Cavities

Tooth-coloured fillings and other suitable treatments can restore teeth affected by decay and help preserve their function.

Cavity Prevention

Fluoride applications and dental sealants may be recommended to protect teeth, depending on the child's age and risk of tooth decay.

Monitoring Dental Development

Regular visits help track the eruption of permanent teeth, identify bite concerns, and recognise issues that may need early attention.

Why Are Early Dental Visits Important?

Baby teeth are important even though they eventually fall out. They help children chew comfortably, support speech development, and maintain space for permanent teeth.

Early dental visits can help identify concerns before they become more complicated. Parents can also receive practical guidance on brushing, snacks, sugary drinks, thumb-sucking habits, and other factors that affect oral health.

Consider arranging a dental visit if your child has tooth pain, visible cavities, gum swelling, sensitivity, dental injury, or difficulty eating. A dental check-up is also useful even when no symptoms are present.

What Happens During a Child’s Dental Visit?

Every visit is adapted to the child's age, comfort level and dental needs.

1. Getting comfortable: The dental team explains the visit in simple, reassuring language.

   "C:\Jerush-dentoface-new-site-react\public\images\medical-services\dental-care\kids-dentistry-pedodontics\pediatric-dental-care\getting-comfortable.webp"

2. Checking the teeth and gums: The dentist looks for tooth decay, gum concerns and developmental changes.

   "C:\Jerush-dentoface-new-site-react\public\images\medical-services\dental-care\kids-dentistry-pedodontics\pediatric-dental-care\checking-teeth-gums.webp"

3. Discussing the findings: Parents receive an explanation of the child's oral health and any recommended treatment.

   "C:\Jerush-dentoface-new-site-react\public\images\medical-services\dental-care\kids-dentistry-pedodontics\pediatric-dental-care\discussing-the-findings.webp"

4. Planning the next steps: The dentist suggests preventive care, treatment, or follow-up visits as needed.

   "C:\Jerush-dentoface-new-site-react\public\images\medical-services\dental-care\kids-dentistry-pedodontics\pediatric-dental-care\planning-next-steps.webp"

X-rays are not required at every visit. They are recommended only when clinically appropriate.

Helping Children Maintain Healthy Teeth at Home

Parents and caregivers play an important role in children's oral health. These everyday habits can make a difference:

- Brush twice daily using an age-appropriate toothbrush and fluoride toothpaste in the recommended amount.
- Help or supervise brushing until the child can clean all tooth surfaces effectively.
- Limit frequent sugary snacks and sweetened drinks.
- Encourage water between meals.
- Avoid putting a baby to sleep with a bottle containing milk or sugary drinks.
- Arrange regular dental check-ups based on the dentist's advice.

The aim is to make dental care a consistent, positive routine rather than something children associate only with pain.

Frequently Asked Questions

1. At what age should my child first visit a dentist?

A child's first dental visit is generally recommended by the first birthday or within six months after the first tooth appears.

2. Do baby teeth really need treatment?

Yes. Untreated decay in baby teeth can cause pain, infection, and difficulty eating. Treatment depends on the tooth's condition and how soon it is expected to fall out.

3. How often should children visit the dentist?

Many children benefit from check-ups every six months, but the ideal interval depends on their cavity risk and individual oral health needs.

4. Are dental X-rays safe for children?

Dental X-rays are used when needed for diagnosis or treatment planning. The dental team selects appropriate images and minimises unnecessary radiation exposure.

5. What should I do if my child is afraid of the dentist?

Explain the visit positively, avoid frightening language, and let the dental team know about your child's concerns. A gradual, reassuring approach may help build confidence.

6. How can I prevent cavities in my child's teeth?

Regular brushing with fluoride toothpaste, limiting sugary foods and drinks, professional check-ups, and preventive treatments when recommended all help reduce the risk of decay.

7. When should I take my child to the dentist urgently?

Seek prompt dental care for severe toothache, facial or gum swelling, dental trauma, or signs of infection. Facial swelling with fever or difficulty swallowing or breathing requires urgent medical attention.

Give Your Child a Healthy Start
